ACKNOWLEDGEMENTS

Bismillahirrahmanirrahim,

Alhamdulillah, my grateful to Allah S.W.T for His bless, finally I completed this project.

First and foremost, I would like to express my sincere appreciation and gratitude to Dr. Behara Satyanarayana as my supervisor, for his kind comments, guidance, encouragement and help throughout this project. His continuous support, advices and discussion were responsible in bringing this thesis to a successful conclusion.

I would like to express my gratefulness to Mr. Johari, who helped me during my sampling and identified those species. Also to Mr. Sainol, Mr. Hazrul, Mr. Fathi and all lab assistance in MOSEA for guiding and help me to analyze my sample.

Thank you to my family for their love and support during my education years. Especially my lovely parents, Mr. Razalli and Madam Rokiah who have bring me to all of this wonderful life. My thanks also to Idzhar Hakimi, my fellow friends who helped me directly or indirectly. Last but not least, I would like to extend again my sincere appreciation and gratitude to all those who have helped me in accomplishing this project.

Species picture of benthic organism

ABSTRACT

The present study is to perform a survey on the composition and distribution of macrobenthos at Tumpat mangrove environment of Kelantan Delta. The faunal samples were collected using a benthic dredge, and the sediment samples by Ekman grab. Altogether, 18 species were encountered belonging to different groups such as annelids, gastropods, bivalves, crabs and shrimps. The Bray-Curtis similarity (hierarchical clustering) based on faunal abundance (root-transformed) data revealed six species' associations/groupings at Tumpat covering Bay, mangrove and estuarine waterways. Among others, gastropoda is the dominant group of benthic organisms. On the whole, species diversity is rich in the mangrove area (e.g. Station O4) ($H'=1.3521$) followed by bay (e.g. Station A5) ($H'=1.11999$) and the estuary (e.g. Station D8) ($H'=1.012663$) in the order. The sediment nature is mostly composed of sand at seaward locations, while clay characterized mangrove/Bay environment. The species-environment relationship was examined through Canoconial Correspondence Analysis (CCA), and it has been observed that the bivalve population was abundant exclusively in the Bay side locations (preferring sandy bottom), whereas gastropods including polycaeta/crabs inhabited mangrove/estuarine regions preferred clayey-silt sediment.

ABSTRAK

Kajian ini adalah untuk membuat survey terhadap komposisi dan taburan makrobentos di persekitaran paya bakau di Delta Kelantan, Tumpat. Sampel fauna di ambil menggunakan 'benthic dredge' dan sampel sediment menggunakan 'ekman grab'. Kesemuanya, 18 spesis didapati merujuk kepada kumpulan yang berbeza seperti anelida, gastropoda, bivalvia, ketam dan udang. 'Bray-Curtis similarity (hierarchical clustering)' berdasarkan kelimpahan fauna (root-transformed) data mendedahkan 6 spesis yang berkaitan /berkumpulan di Tumpat termasuk teluk, paya bakau dan muara. Diantara semua, gastropoda adalah kumpulan organisma bentik yang dominan. Secara keseluruhannya, kepelbagaian spesis yang kaya dengan organisma adalah di kawasan paya bakau.(Contoh: Stesen O4) ($H' = 1.3521$) diikuti dengan teluk (contoh: Stesen A5) ($H' = 1.11999$) dan di kawasan muara (contoh: Stesen D8) ($H' = 1.012663$) mengikut turutan. Kesemulajadian sedimen mengarah ke laut kebanyakannya didominasi oleh pasir, manakala kelodak mewakili kawasan paya bakau/teluk. Perkaitan antara spesis dengan persekitaran di periksa menggunakan 'Canocional Correspondence Analysis (CCA)', dan ia telah menunjukkan bahawa populasi bivalvia berada secara eksklusif di teluk (lebih kepada dasar berpasir), manakala gastropoda termasuk polichaeta/ketam hidup di kawasan paya bakau/ muara yang lebih memilih sedimen berkelodak dan berlumpur.
