EVAPORATION OF MICROEMULSION WITH ESTERS

By

ONG BEE LING

Approved By:

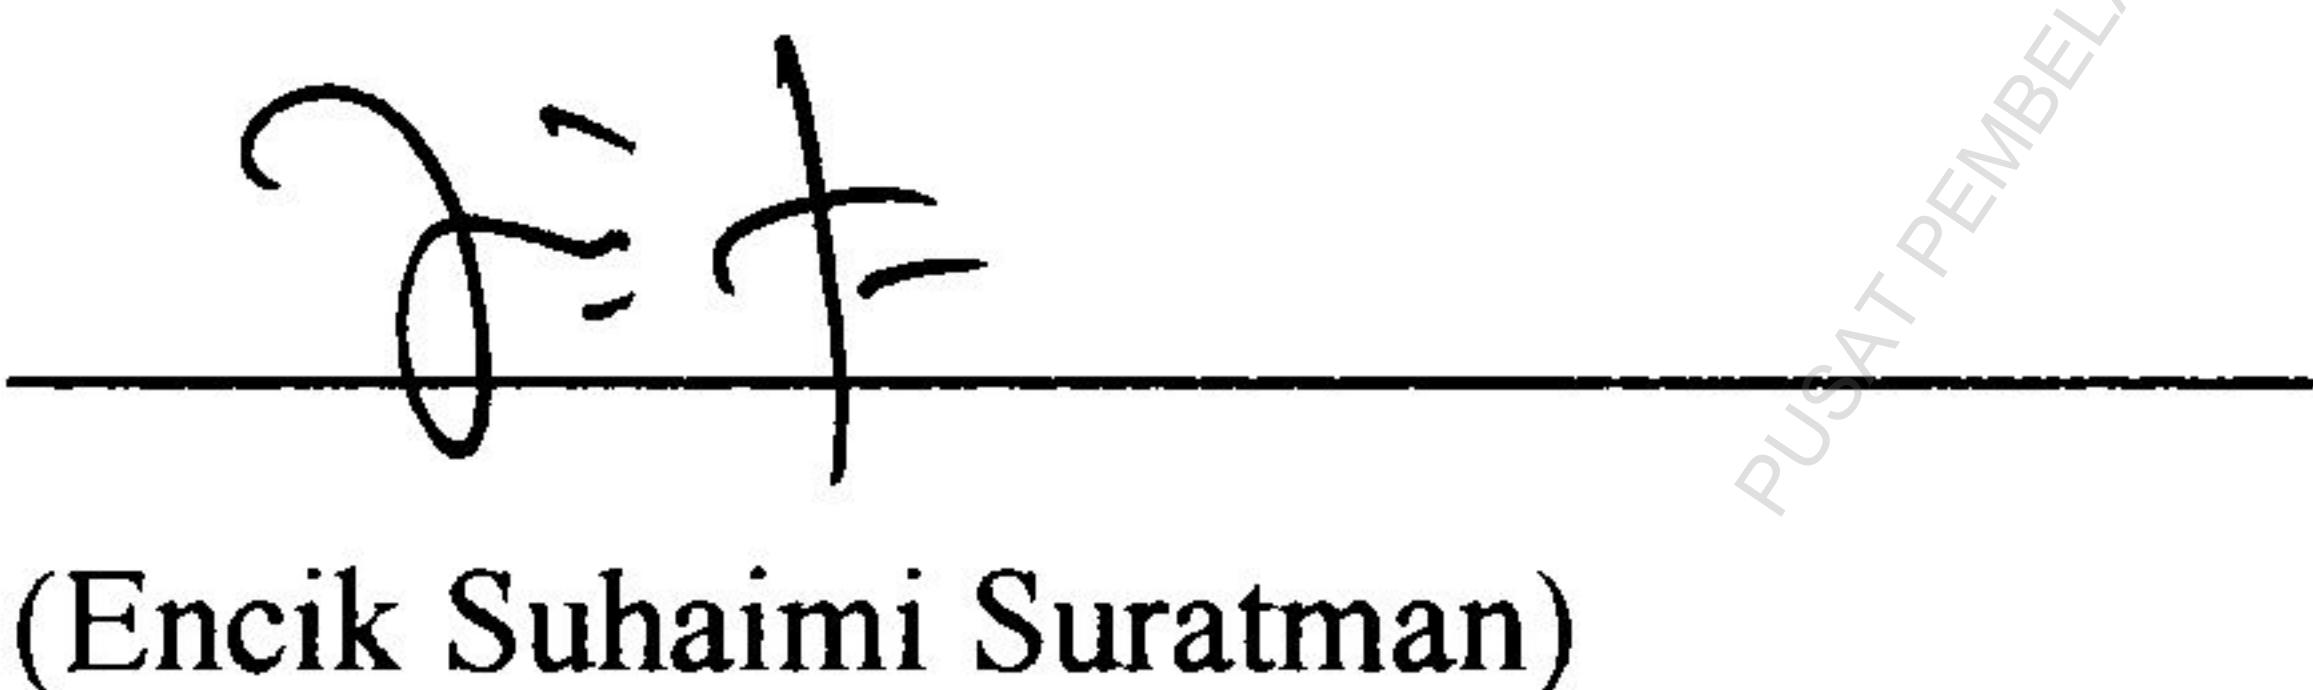

Supervisor

(Prof. Dr. Hamdan Hj. Suhaimi)

Date: 21/6/02

Coordinator

(Encik Suhaimi Suratman)

Date: 21/6/02

Acting Head of Chemical Science

Date: 21/6/02

(Prof. Dr. Law Ah Theem)

ACKNOWLEDGEMENT

Firstly, I would like to take this opportunity to express my heartfelt gratitude and indebtedness to my supervisor, Professor Dr. Hamdan Hj. Suhaimi for his invaluable advice, unlimited support, effective guidance, and caring and constructive criticism throughout the preparation of this project. Besides, I would like to express my appreciation and exaltation to the lab assistants in the Chemistry Department on their fully cooperation.

I also like to acknowledge to all my friends and all my lovely course mates who makes this three years a meaningful one. With their concern, encouragement and support, I managed to finish my project successfully.

In addition, I would like to record my deepest appreciation to my beloved family for their moral support and encouragement throughout my whole study in these three years. I am also indebted Mr. Kong for being my English Grammar teacher in this project.

Lastly, I wish to thank to whom had helped me in completing my project successfully.

Thank You Everybody.

ABSTRAK

Kajian terhadap sifat gambarajah fasa telah dilakukan ke atas sistem air / surfaktan / ester dan gliserol / surfaktan / ester untuk penyediaan mikroemulsi pada suhu dan kelembapan persekitaran. Agen emulsi yang digunakan dalam projek ini ialah triethanolamine dan 1-pentanol dengan nisbah berat 25 : 75 manakala ester yang digunakan pula ialah ioamyl acetate dan isoamyl butyrate. Kawasan mikroemulsi telah diperhatikan dalam kedua-dua sistem. Akan tetapi, kawasan mikroemulsi yang kecil sahaja didapati tanpa menggunakan ko-surfaktan (1-pentanol). Ko-surfaktan digunakan untuk menstabilkan trietanolamine supaya kawasan mikroemulsi menjadi lebih besar setelah co-surfaktan ditambahkan. Daripada pemerhatian yang didapati, kawasan mikromulsi bagi sistem gliserol lebih stabil daripada sistem akues. Ester isoamyl acetate juga membentuk kawasn mikroemulsi yang lebih besar daripada ester isoamyl butyrate.

Kehilangan berat daripada pemruapan dalam sistem mikroemulsi adalah lebih tinggi di ester isoamyl acetate dalam sistem akues. Kehilangan berat dan kadar pemruapan bergantung kepada nisbah bahan surfaktan, ester dan kandungan pelarut. Kandungan ester dan kandungan pelarut yang tinggi menyebabkan kadar pemruapan yang lebih tinggi. Bagi sistem yang bukan akues, kadar pemruapan dan kehilangan berat menurun dengan kandungan gliserol.

ABSTRACT

The phase behaviour of aqueous (water / surfactant / esters) and non-aqueous (glycerol / surfactant / esters) systems were investigated to prepare microemulsions at ambient humidity and room temperature. Triethanolamine and 1-pentanol with the ratio 25 : 75 were used as emulsifier. While the ester were isoamyl acetate and isoamyl butyrate. Microemulsion regions were observed in both systems, however a smaller region was observed without a co-surfactant (1-pentanol). Co-surfactant was added to stabilize the triethanolamine in order to form a larger microemulsion region and a larger region resulted after adding the co-surfactant. The solubility region of non-aqueous system was larger than aqueous system. In addition, the microemulsion with isoamyl acetate was larger than the isoamyl butyrate counterpart.

The weight loss turning evaporation was found to be larger in the aqueous system with isoamyl acetate in the ester component. The weight loss and evaporation rate were found to be dependent on the weight ratio of esters, triethanolamine, 1-pentanol, water and glycerol content. A higher weight ratio and water content led to higher evaporation. In addition, lower surfactant content led to a higher evaporation. In the non-aqueous system, the evaporation rate decreased with the esters content.
