**COMPARISON BETWEEN LEE AND KUAN ALGORITHM FOR OIL SPILL
DETECTION FROM SAR IMAGES**

By

Amirah Binti Hj. Mustafa

**Research Report submitted in partial fulfillment of
the requirements for the degree of
Bachelor of Science (Marine Science)**

**Department of Marine Science
Faculty of Science and Technology
2005**

This project report should be cited as:

Amirah, M., 2005. Comparison between Lee and Kuan Algorithm for Oil spill Detection from SAR Images. Final Year Project Report, Bachelor of Marine Science, Faculty of Science and Technology, University College Science and Technology Malaysia (KUSTEM), Terengganu. 60 p.

No part of this report may be reproduced by any mechanical, photographic or electronic process or in the form of photography recording, nor may it be stored in a retrieval system, transmitted or otherwise copied for public or private use, without written permission from author and supervisor of the project.

TECHNOLOGY MALAYSIA

RESEARCH PROJECT FINAL DRAF APPROVAL AND VALIDATION
FROM I AND II

I certify that the report of this final year project entitled as:
Comparison between Lee and Kuan Algorithm for Oil Spill Detection from SAR Images by Amirah Binti Mustafa, Matric No. UK 6483 has been read and all the alteration and correction recommended by examiners have been done. This final draft submitted to Department of Marine Science has been accepted as fulfillment of the requirement for Bachelor of Science (Marine Science) under the Faculty of Science and Technology, University College Science and Technology

Approved by:

Main Supervisor

Name: Dr Maged Mohmood Marghany

Date: 9/4/05

ACKNOWLEDGEMENT

Alhamdulillah, praise to Allah for His blessing which enabled me to finish this project. I would like to take this opportunity to express my sincere gratitude and appreciation to those who had helped me to make this project running smoothly.

Firstly, I wish to thank my supervisor Dr. Maged Marghany Mahmood for his guidance, suggestion and encouragement completion of my study.

Not to forget the Science Officer at Informatics Lab in INOS, En. Sufian B. Idris, Science Officer at FST, En. Azahari Muda and Pn. Nora Binti Ibrahim, Lab Assistant at Remote Sensing Lab and En Helmi from Malaysian Meteorological Center. A lot of thank for your valuable help.

Special thanks go to my lovely friends, Haslina, Nurulaini and Ismanura, Dila, Jue, Yatie, Azey and Eija and my Marine Science outstanding buddies and others who directly or indirectly involved.

Especially to my understanding parents, Hj. Mustafa Bin Ismail and Hjh. Zaharah Binti Ibrahim, my elder sister Nurulhuda thanks for your support, understanding and concern during the period I had done this project.

ABSTRACT

An important and serious cause of marine pollution at sea surface is oil spill pollution. Oil spill usually occur at main ship traffic routes, near to platforms or in mouth of rivers or estuaries. The application of RADARSAT satellites are being used to routinely monitor ocean oil pollution. Their main advantages are independence of the sun light. That mean its can be used at day and night. However, they will present speckle and noise. To reduce these speckle and noise, adaptive filter was used. This study mainly concerned on comparison between Lee and Kuan Algorithm for oil spill detection from SAR images. Lee algorithm was used to determine the linearity of oil movements, while Kuan algorithm was used to enhance ships. This study shows that different algorithm was given different output. Window 7x7 was the best filter for Lee algorithm and 11x11 for Kuan algorithm. Image classification was used to get information about oil spill thickness and area of spillage. Sometime, not all dark slicks were oil slick. It can be a look-alike that cause by natural environment or low wind speed. Mean value of backscatter at oil slick area was 34.4 ± 0.5 . Sea condition at this area is calm and wind speed were around 6 m/s while mean direction surface were around 50° from North.

ABSTRAK

Tumpahan minyak merupakan satu pencemaran serius terutama di laut. Biasanya terjadi di laluan utama kapal, berhampiran pelantar minyak atau berdekatan muara sungai. Aplikasi Radarsat satelit sangat berguna untuk pemantauan pencemaran minyak yang berlaku di laut. Kebaikan utama ialah ianya tidak memerlukan cahaya matahari untuk berfungsi dan boleh digunakan pada waktu malam. Selain itu, ianya juga menghasilkan tompokan dan gangguan. Untuk mengurangkan gangguan ini, 'adaptive filter' digunakan. Tujuan utama kajian ini dijalankan ialah untuk membandingkan penggunaan Lee algoritma dengan Kuan algoritma dalam mengesan tumpahan minyak dengan menggunakan SAR imej. Lee algoritma didapati dapat mengesan tumpahan minyak secara linear manakala Kuan algoritma dapat mengesan kehadiran kapal. Penggunaan algoritma yang berbeza akan menghasilkan output yang berbeza. Tetingkap 7×7 sesuai digunakan untuk Lee algorism manakala tetingkap 11×11 sesuai untuk Kuan algoritma. Pengkelasan imej dibuat untuk mendapatkan nilai ketebalan dan kawasan penyebaran tumpahan minyak. Kadangkala kawasan gelap merupakan kawasan 'look-alike'. Ianya mungkin disebabkan oleh aktiviti semulajadi atau kawasan tiupan angin yang lemah. Nilai mean bagi kawasan tumpahan minyak ialah 34.4 ± 0.5 dengan kadar tiupan angin ialah 6 m/s ke arah 50° utara.
