**PENGAKUAN DAN PEGESAHAN LAPORAN
PROJEK PENYELIDIKAN I DAN II**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

The effects of tomato extracts on the oxidative stability of palm olein

Dijalankan oleh **Sin Siew Peng**, No. Matrik **UK 6563** telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Kimia sebagai memenuhi sebahagian daripada keperluan memperoleh Ijazah Sarjana Muda Sains Kimia. Fakulti Sains dan Teknologi, Kolej Universiti Sains dan Teknologi Malaysia.

ACKNOWLEDGEMENTS

First and foremost, I would like to express my deepest gratitude to my supervisor, Prof. Madya Dr. Ku Halim Ku Bulat for his concerns, guidances and valuable advices. Without his guidance, I would not be able to learn so much in the progress of completing this final year project. I would also like to thanks Dr. Wan Norsani B. Wan Nik for his supports and guidances throughout the whole development of this project.

Secondly, I would like to express my appreciation to all the laboratory assistants, especially En. Jamaluddin Jusoh who always assisted me throughout the period of finishing the project. Not forgetting, Dr. Jurrifah Ariffin who was our final year project coordinator for her guidance's to lead us to finish the project.

Besides, my sincere gratitude goes to those who have assisted and supported me to complete this study, especially Mr. Lau Pek Chuen, Mr.Ong Yik Seng, Mr. Yau Hon Lim, Ms. Chek Yin Sez and Ms. Lee Ting Ting. Thank you so much, my friends.

ABSTRACT

In this study, tomato (*Lycopersicon esculentum*) was extracted by methanol and hexane respectively. Methanolic extract was subfractionated by liquid-liquid partition using dichloromethane, ethyl acetate, butanol and water. The structures of all tomato extracts were analyzed by using thin-layer chromatography (TLC), Fourier-transform infrared (FTIR) spectroscopy and ultraviolet-visible (UV-Vis) spectroscopy. The oxidative stability of palm olein in presence of 1% hexane extract, each subfraction of methanolic extract and α -tocopherol were tested respectively by using thermogravimetric analysis (TGA) in oxygen atmosphere. With regard to weight gain percent and initial oxidation temperature, α -tocopherol and all tomato extracts effectively reduced the oxidation rate of the palm olein compared with palm olein without any additive (PO). Palm olein in presence of 1% dichloromethane subfraction of methanol extract (POD) had showed the lowest oxidation rate. To confirm the relative rates of oxidative deterioration, POD and PO were heating at 135°C for 200 hours and analyzed periodically for their peroxide value (PV), iodine value (IV), acid value (AV). In addition, the thermal-oxidative stabilities of PO and POD were analyzed using TGA in nitrogen atmosphere and IR analysis. The results showed that POD effectively reduced the oxidation rate compared PO as detected by higher degradation temperature and onset temperature, less increasing intensity of region C=O, lower PV and TAN, relatively higher IV for all the heating time.

KESAN TOMATO EKSTRAK TOMATO PADA KESTABILAN PENGOKSIDAAN OLEIN KELAPA SAWIT

ABSTRAK

Dalam kajian ini, tomato (*Lycopersicon esculentum*) telah diektrak dengan hexane dan methanol masing-masing. Metanolik ekstrak dibahagikan oleh empat pelarut pembahagian dengan diklorometana, etil acetate dan butanol. Sifat-sifat bagi semua tomato ekstrak telah dikaji dengan kromatografi lapisan nipis, spektroskopi Fourier Transformasi Inframerah dan spektroskopi ultralembayung-nampak. Kestabilan pengoksidaan olein kelapa sawit yang ditambah 1% ekstrak hexane, setiap sub-pengektrakan dan α -tocoferol telah diuji masing-masing dengan analisis termogravimetri dalam oksigen. Berdasarkan peratus berat dan suhu permulaan pengoksidaan, semua ekstrak tomato dan α -tocoferol sebagai antioksidan dapat mengurangkan kadar pengoksidaan olein kelapa sawit dengan berbanding dengan olein kelapa sawit yang tiada penambah (PO). Olein kelapa sawit yang ditambahkan 1% sub-pengektrakan dichlorometana (POD) telah menunjukkan kadar pengoksidaan paling rendah. Untuk mengkaji kadar kemerosotan, PO dan POD telah dipanaskan pada 135°C selama 200 jam. Nilai-nilai peroksida, iodin dan asid PO dan POD telah ditentukan dari masa ke masa. Tambahan pula, analisis termogravimetri dalam nitrogen dan spektroskopi Fourier Transformasi Inframerah digunakan untuk mengkaji kestabilan pengoksidaan PO dan POD. Keputusan menunjukkan POD dapat mengurangkan kadar pengoksidaan berbanding dengan PO kerana suhu penurunan dan suhu mula yang lebih tinggi, penambahan keluasan C=O yang lebih kurang, nilai-nilai peroksida dan asid yang lebih rendah dan nilai iodine yang lebih tinggi untuk semua masa pemanasan.
