This project report should be cited as:

Maria, S.H. 2006. A study on the Content Of Heavy Metals Cadmium (Cd), Copper (Cu), Zinc (Zn), Manganese (Mn) And Lead (Pb) In Oysters (*Crassostrea Iredalei*) From Oyster Culture Area In Setiu Lagoon. Undergraduate thesis, Bachelor of Science in Marine Science, Faculty of Science and Technology, Kolej Universiti Sains dan Teknologi Malaysia, Terengganu. 60p.

No part of this project report may be reproduced by any mechanical, photographic, or electronic process, or in the form of phonographic recording, nor may it be stored in a retrieval system, transmitted, or otherwise copied for public or private use, without written permission from the author and supervisor (s) of the project.

ACKNOWLEDGEMENTS

First of all, I would like to express my sincere appreciation and deepest gratitude to my co-supervisor, Prof. Dr. Noor Azhar Bin Muhamed Shazili and my vice supervisor, Dr Nor Antonina Abdullah for their advice, guidance and assistance throughout the course of study.

I'm also glad to wish my gratitude to my communication science lecturer, Dr Mariam Taib, all Master Students (Mrs. Syarifah Nur Maisarah, Benny, Joseph, and William), besides staff of Marine Science Department, Faculty of Science and Technology, especially the lab assistants (Oceanography Laboratory) for their help and cooperation in laboratory work.

Acknowledgement also extended all friends and course mates for helping me in all research work, discussion and for their cooperation to completing my project.

Last but not least, my greatest appreciation and acknowledge the sacrifice, encouragement and kindness, to my beloved parents and all family members for their support to complete the thesis.

ABSTRACT

Oysters are recognized as pollution bioindicators as they have the ability to accumulate pollutants in their tissues at elevated levels in relation to pollutants in the marine environment. The objectives of this study were to measure the levels of some heavy metals (Cd, Cu, Mn, Zn and Pb) in different oyster (*Crassostrea iridalei*) sizes from Setiu Lagoon, Terengganu. It is also to use oyster as biological indicator in monitoring heavy metals pollution in the studied area. Three different sizes of oyster were collected in August and October 2005 from cultured rafts. *Crassostrea iridalei* (dry weight) had the highest concentration of Zn ($221.40 \pm 25.57 \mu\text{g/g}$), followed by Cu ($31.65 \pm 6.34 \mu\text{g/g}$), Mn ($17.89 \pm 3.36 \mu\text{g/g}$), and Cd ($6.65 \pm 0.44 \mu\text{g/g}$). Pb ($7.12 \pm 2.25 \mu\text{g/g}$) showed the lowest concentration compared to other metals. The ability of oyster to concentrate Cu and Zn is higher in large oyster compared to small oysters, with metal levels increasing with sizes. However, Cd, Mn and Pb content are not influenced by size. Concentrations of Zn, Cd, and Pb in the oysters were high, with Cd exceeding the permissible limit set by Malaysian Food Act 1983 and Pb near the limit. As concentration of Cd is high in oyster, the potential risk of consuming oysters is relatively higher than other seafood.

ABSTRAK

Tiram telah dikenali diseluruh dunia sebagai penunjuk biologi bagi mengesan pencemaran kerana ia mempunyai keupayaan untuk mengumpul bahan pencemar di dalam tisu pada paras tertinggi dari persekitaran marin. Kajian ini, menggunakan *Crassostrea iredalei* sebagai penunjuk biologi bagi pencemaran logam berat dikawasan penternakan tiram di Setiu Lagun, Terengganu. Tiram dari tiga saiz berbeza dikumpulkan pada bulan Ogos dan juga Oktober 2005 bagi penganalisaan logam berat. Daripada keputusan yang diperolehi, *C.iredalei* (berat kering) menunjukkan pengumpulan tertinggi bagi zink ($221.40 \pm 25.57 \mu\text{g/g}$) dan diikuti oleh kuprum ($31.65 \pm 6.34 \mu\text{g/g}$), mangan ($17.89 \pm 3.36 \mu\text{g/g}$), dan kadmium ($6.65 \pm 0.44 \mu\text{g/g}$). Plumbum ($7.12 \pm 2.25 \mu\text{g/g}$) merupakan logam terendah yang dikumpulkan oleh tiram berbanding logam lain. Keputusan yang diperolehi menunjukkan, keupayaan tiram untuk mengumpul logam Cu dan Zn lebih tinggi berbanding tiram bersaiz kecil. Bagaimanapun, Pb, Cd dan Mn menunjukkan kepekatan yang hampir setara bagi ketiga-tiga saiz. Oleh kerana kepekatan Cd adalah tinggi didalam tiram berbanding tahap yang dibenarkan dalam Akta Makanan Malaysia 1983, maka potensi terhadap risiko memakan tiram ini adalah lebih tinggi berbanding makanan laut lain.
