ACKNOWLEDGEMENTS

Firstly and foremost, I would like to add my deepest appreciation and sincere to my supervisor, Assoc Prof. Dr. Abol Munafi Bin Ambok Bolong for his supervision, comments, guidance and assistance throughout this project. Sincere thanks also to Assoc Prof. Aizam Bin Zainal Abidin for his idea on this project. Besides, my heartfelt gratitude goes to Madam Suhaila and Mr Sharol for their cooperation and permission to use facilities in laboratory. Many thanks to Master student, Miss Sanisah and all the people in Marine Hatchery for the help and cooperation. Not forget to Balkish and Nor Ashikin, who really close to me in giving me support. Appreciation is extended to my mum and dad in giving me spiritual support. Finally, my appreciation goes to those who have contributed to this project.

ABSTRACT

Tetraselmis suecica and *Isocrysis galbana* was cultured in different salinities; 12 ppt, 18 ppt, 24 ppt and 36 ppt. The cultivation of the algae was done in two different media; CONWAY and TMRL. The propagation was done in Batch Culture technique started from agar plate streaking, test tubes culturing and transferring to 250 ml and 1000 ml Erlenmeyer flasks. *Tetraselmis suecica*, which cultured using CONWAY grows better in salinity of 24 ppt with the cell density of 4.400×10^6 cellml⁻¹ whilst in TMRL nutrient media, the best salinity is 18 ppt (cell density of 4.020×10^6 cellml⁻¹). For *Isochrysis galbana*, the cell density is highest in salinity 24 ppt (3.673×10^6 cellml⁻¹) using the TMRL media and by comparing this to CONWAY media, the cell density is highest (4.650×10^6 cellml⁻¹) in the salinity of 36 ppt. Thus, the best growth of *Tetraselmis suecica* and *Isochrysis galbana* can be obtained at 24 ppt culturing using CONWAY media.

ABSTRAK

Tetraselmis suecica dan *Isochrysis galbana* telah dikultur dalam saliniti yang berbeza iaitu 12 ppt, 18 ppt, 24 ppt dan 36 ppt. Pengkulturan alga ini dikultur di dalam dua media yang berbeza iaitu CONWAY dan TMRL. Pengkulturan alga ini dijalankan secara ‘Batch Culture’ iaitu bermula dari lorekkan pada plat agar, pengkulturan dalam tabung uji dan dipindahkan ke kelalang Erlenmeyer bersaiz 250 ml dan 1000 ml. *Tetraselmis suecica* yang dikultur menggunakan media CONWAY tumbuh dengan baik pada saliniti 24 dengan kepadatan sel sebanyak 4.400×10^6 selml⁻¹ sementara dalam media TMRL, saliniti terbaik ialah 18 ppt (kepadatan sel 4.020×10^6 selml⁻¹). Bagi *Isochrysis galbana*, populasi sel adalah adalah tinggi dalam saliniti 24 ppt (3.673×10^6 selml⁻¹) dengan menggunakan media TMRL dan apabila membandingkannya dengan media CONWAY, kepadatan sel adalah tinggi (4.650×10^6 selml⁻¹) pada saliniti 36 ppt. Dengan demikian, pertumbuhan terbaik untuk *Tetraselmis suecica* dan *Isochrysis galbana* boleh didapati pada saliniti 24 ppt dengan menggunakan media CONWAY.
