GARBAGE COLLECTOR

(WASTE MANAGEMENT SYSTEM)

To keep good health you must ensure that your home and work environment is hygienic. For this, you must choose some professional company that offers residential garbage can cleaning services. These days at most of the places, we have wheelie bin garbage cans because they are easy to handle and clean. Therefore offers complete mobile domestic wheelie bin cleaning system with top wheelie bin cleaning equipment to provide you with the best quality services.

Our unique sanitizing processes along with garbage can cleaning using highly effective antibacterial detergents ensures that you get environmentally friendly residential cleaning service without damaging the environment. Our domestic wheelie cleaning system ensures this by collecting the waste water and garbage in our vehicle mounted trash can washing system and then disposing the waste at the proper place thus eliminating the risk of unpleasant odors, the presence of flies, ants and other pests, and as well the potential risk of bacteria.

ACKNOWLEDGEMENTS

Alhamdulilah and thanks to Allah S.W.T for blessing and giving me strength to accomplish the experiment and report writing. There were experiences I have gain throughout the project started till the last draft.

First of all, I want to convey my highest appreciation to my supervisor, Madam Norhayati Yusuf and not forgetting my co-supervisor Dr. Aziz b. Ahmad and Dr Chua from FASM. Their wonderful guidance and encouragement for the project was amazing. I have learned so much from them and expand my horizon through the experience that I have gain. I am also wanted to appreciate to lab assistants for their dedication to help me.

I would like to take this opportunity to convey my special appreciation to my parent and my friends especially Kak Suzi, Rehan and Cik Bob for their support and encouragement in completing my project. Nevertheless, their passion to help others was the greatest thing somebody can give.

ABSTRACT

Plants possess a number of antioxidants that protect against environmental stress (salinity) that effect their growth and productivity. Among of these antioxidants includes enzymatic antioxidants and non enzymatic antioxidants. The objective of this research was to determine the effects of different concentrations of NaCl on the ascorbate peroxidase (APx), catalase (CAT) and guaiacol peroxidase (POD) specific activities in *Cryptocoryne ciliata*. *C. ciliata* was treated with 0, 25, 50 and 100 mM NaCl in Murashige and Skoog solid medium for 28 days. The specific activities of these antioxidative enzymes were detected every 0, 1, 2, 7, 14, and 28 days of treatment periods. NaCl treatment significantly induced the APx and POD especially at later stages of treatment periods. Higher NaCl concentration led to great increased of APx and POD specific activities. However, CAT specific activities were significantly reduced. The reduction was greater in the cultures treated with higher NaCl concentration. These results suggest that salinity treatment stimulates oxidative stress in *C. ciliata* by inducing the APx and POD antioxidative specific activities and reduced the CAT specific activities. The antioxidant metabolism has been shown to be important in determining the ability of *C. ciliata* to survive in salinity stress and the up regulation of these enzymes would help to reduce the build up of reactive oxygen species (ROS).

**KESAN SALINITI KE ATAS AKTIVITI SPESIFIK ENZIM ANTIOKSIDAN DI
DALAM KULTUR *Cryptocoryne ciliata***

ABSTRAK

Tumbuhan mempunyai pelbagai jenis antioksidan yang akan melindunginya daripada tegasan persekitaran (saliniti) yang memberi kesan kepada pertumbuhan dan produktiviti tumbuhan. Di antara antioksidan ini termasuk enzim dan bukan enzim. Tujuan kajian ini adalah untuk menentukan kesan kepekatan NaCl yang berbeza ke atas aktiviti spesifik enzim askorbat peroksida (APx), katalase (CAT) dan guaiacol peroksida (POD) dalam *Cryptocoryne ciliata*. *C. ciliata* dirawat dengan 0, 25, 50 dan 100mM NaCl selama 28 hari di dalam media pepejal Murashige dan Skoog. Aktiviti spesifik enzim antioksidan ditentukan setiap 0, 1, 2, 7, 14, dan 28 hari rawatan. Rawatan NaCl merangsang aktiviti enzim APx dan POD terutama pada tempoh akhir rawatan. Peningkatan kepekatan NaCl, meningkatkan aktiviti spesifik enzim APx dan POD. Walau bagaimanapun, aktiviti spesifik enzim CAT menurun dengan signifikan. Penurunan semakin ketara apabila dirawat dengan kepekatan tinggi NaCl. Keputusan ini mencadangkan bahawa rawatan saliniti merangsang tegasan oksidatif dalam *C. ciliata* dengan meningkatkan aktiviti spesifik enzim APx dan POD dan menurunkan aktiviti spesifik enzim CAT. Metabolisma antioksidan menunjukkan kepentingan kebolehan *C. ciliata* untuk terus hidup dalam tegasan saliniti dan menaikkan pengaturan enzim-enzim ini yang menolong mengurangkan pembentukan spesies oksigen reaktif (ROS).
