**DECLARATION AND VERIFICATION REPORT
FINAL YEAR RESEARCH PROJECT**

It is hereby declared and verified that this research report entitled:

Mapping coral reef distribution at Bidong Island by Quickbird satellite imaginary by **Azreen Bin Awang** Matric No. **UK 17456** have been examined and all errors identified have been corrected. This report is submitted to the Department of Marine Science as partial fulfillment towards obtaining the Degree **Bachelor of Science (Marine Science)**, Faculty of Maritime Studies and Marine Science, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENTS

All praises and thanks be to Allah (S.W.T), who has guided us to this, never could we have found guidance, were it not that Allah had guided us!(Q7:43)

First and foremost, my deepest gratitude goes to Allah S.W.T for helps and guidance which gave me strength to finish this project on mapping coral reef distribution at Bidong Island by Quickbird satellite imagery. Throughout of a year doing this project, I have faced a lot of problems and challenges which taught me to be strong.

I would like to thank my supervisor Dr Razak Zakariya for their precious guidance, advice and continuous support through out the completion of this project. His supervision and encouragement made me more confident to solve all the problems that occurred during my project.

Since thanks are also extended to master students and other senior that guiding me in completing my project. I also would like to express my appreciation to all the laboratory assistants and staff in UMT, without their helps, my thesis would hardly complete.

Last but not least, my sincere gratitude to my beloved family for their endless support and care.

LIST OF ABBREVIATIONS

π	3.142
%	Percentage
$^{\circ}\text{C}$	Degree Celsius
ρ	Satellite reflectance
$\Delta\lambda_{\text{Band}}$	Effective bandwidth of each band
absCalFactorBand	Absolute radiometric calibration factor ($\text{Wm}^{-2}\text{sr}^{-1}\text{count}^{-1}$)
d^2	The square of the earth sun distance in astronomical units
DN	Digital number
$\text{Ed}(\lambda,0^{\circ})$	Downward irradiance
EMR	Electromagnetic radiation
ENVI	Environment for Visualizing Images
ESUN	Mean solar irradiance
$\text{Eu}(\lambda,0^{\circ})$	Upwelling irradiance
FLAASH	Fast Line of sight Atmospheric analysis of spectral hypercube
Km	Kilometer
$\text{Kd}(\lambda)$	Diffuse attenuation coefficient
K_i / K_j	Ratio attenuation coefficient
L	Satellite radiance
L_i	Atmospheric corrected image of b_l
$\text{Lu}(\lambda,z)$	Vertical profiling of upward radiance
$q_{\text{pixel},\text{Band}}$	Digital value
RGB	Red, green ,blue
ROI	Region of interest
SZ	Sun zenith angle
X_i	Normalized image in b_i

ABSTRACT

This study is an attempt to investigate the applicability of Optical satellite image for coral Mapping. The aim is to determine the coral reef distribution at Bidong Island. Mapping of coral reef using 2.4 m high resolution Quickbird satellite imagery is done at Bidong Island that consist of Karah Island and Tengkarah Island which is location in the South China Sea. The Island is actually a Coral Reef atoll with no land insight. The image processing process consists of 6 step which are, geometric correction, atmospheric correction, water column correction, and classification and accuracy assesment. The types of substrate classification are life coral, dead coral with algae, rubble coral and sand. The reliability of reef classification has been tested using kappa statistic of 0.2061 %. The overall accuracy of the supervised map is 41.3793% indicated the map of coral reef achieved in this study is reliable.

ABSTRAK

Penyelidikan ini adalah untuk menyiasat kebolehan Imej Satelit Optik untuk pemetaan terumbu karang. Tujuan kajian ini dijalankan adalah untuk menentukan taburan terumbu karang di kawasan pulau bidong. Pemetaan terumbu karang menggunakan imej satelit Quickbird yang mempunyai resolusi tinggi berukuran 2.4 meter telah dilakukan di kawasan pulau bidong dan ianya meliputi pulau karah dan pulau tengkarah yang dikelilingi Laut Cina Selatan yang sangat terkenal dengan keindahan Terumbu karangnya. Teknik pemprosesan imej satellite merangkumi 6 langkah iaitu pembetulan geometric, pembetulan atmosfera, pembetulan medan air, penopenangan imej, klasifikasi dan ketepatan penilaian. Jenis klasifikasi substrat ialah karang hidup, karang mati dengan alga, serpihan karang dan pasir. Tahap kebolegunaan pengkelasan terumbu diuji menggunakan "kappa statistic" dengan keputusan 0.2061 %. Keseluruhan kejituan iaitu 41.3793% dan ia menunjukkan bahawa peta terumbu bagi kawasan ini boleh diguna pakai.
