#### **ACKNOWLEDGEMENTS**

There are several to whom I am grateful for contributing to this study. I apologise to those who have inadvertently been omitted.

To my first supervisor, Ms. Jarina Mohd Jani, my heartfelt thanks for her continuous support, patience and advice throughout the project. To my co-supervisor, Dr. Siti Aishah Abdullah @ Christine Abellana Orosco, my sincere thanks for her encouragement and guidance that have been extended to me throughout my undergraduate studies at KUSTEM / UMT. To the Final Year Project coordinator, Dr. Juanita Joseph, thanks for her advice and dedication.

Many special thanks go out to Su Ee, Chew Sheau Wei, Teh Sabariah, Fong Wee Peng, and Teoh Boon Sim, for their assistance in data collection that has made the high response rate possible. Patience and cooperation of participants are greatly acknowledged for generously collaborating with this project. Finally, this project was made possible through the love and support of my family and friends.

#### **ABSTRACT**

The purpose of this study was to identify the determinants of proenvironmental behaviour from a wide array of situational and psychological factors among students from environment related (EP) and non-environment related (NEP) programmes of University of Malaysia Terengganu (UMT). Knowing the determinants of pro-environmental behaviour (PEB) is crucial to recognize effective approaches to alter attitude and subsequently change the human lifestyle and consumption behaviour, as part of environmental protection. A conceptual framework has been proposed and subjected to empirical verification with the use of a questionnaire survey. Particular attention was given to the interactions between environmental knowledge (EK) and attitude (EA) with other variables. The results obtained provide reasonable support for the validity of the proposed framework. EK and EA were weakly related with PEB; while synergistic effects towards PEB were occurring when EK and EA was incorporated with other determinants. High level of environmental knowledge (HEK), positive environmental attitude (HEA), high level of concern (HC), Bumiputra (BM), awareness of daily activities' impacts on nature (DA) and awareness of responsibility on nature (RP) are the strongest PEB's determinants specifically for EP students. On the other hand, none of the variables examined in the study have causal effect on students' PEB of NEP with comparatively lower level of EK, EA and EB. In short, the present findings provide a better understanding of the process and antecedents of pro-environmental behaviour among EP and NEP students.
