CYTOTOXIC EFFECTS OF LEAD AND CADMIUM ON  
*ACANTHAMOEBA CASTELLANII*: A LABORATORY TEST

By :

Hasmee Heryanti Binti Abdul Ghani

Research Report submitted in partial fulfillment of  
the requirements for the degree of  
Bachelor of Science (Biological Sciences)

Department of Biological Sciences  
Faculty of Science and Technology

KOLEJ UNIVERSITI SAINS DAN TEKNOLOGI MALAYSIA  
2005

This project report should be cited as

Hasmee Heryanti, A. G. 2006. Cytotoxic effects of lead and cadmium on *Acanthamoeba castellanii* : A laboratory test. Undergraduate thesis, Bachelor of Biological Sciences, Faculty of Sciences and Technology, Kolej Universiti Sains Dan Teknologi Malaysia, Terengganu. 62 p

PENGAKUAN DAN PENGESAHAN LAPORAN  
PROJEK PENYELIDIKAN I DAN II

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: CYTOTOXIC EFFECTS OF LEAD AND CADMIUM ON *Acanthamoeba castellanii* oleh Hasmee Heryanti Binti Abdul Ghani, No. Matrik UK 7777 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Biologi sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains- Sains Biologi, Fakulti Sains dan Teknologi, Kolej Universiti Sains dan Teknologi Malaysia.

Disahkan oleh:

Penyelia Utama

## **ACKNOWLEDGEMENT**

Assalamualaikum

Alhamdulillah, with all of patience and effort, I had finished my final year project report in partial fulfillment of the requirements.

First and foremost, I would like to take this golden opportunity to express my sincere gratitude to my supervisor Prof Madya Dr Nakisah Mat Amin for her continuous guidance, careful supervision, advice and helpful comments while reviewing my thesis. This thanks also goes to my co-supervisor Prof Dr. Noor Azhar Mohd Shazili for his significant assistance that enabled me to complete this thesis.

I would like to thank to the laboratory assistants for their help and assistance throughout my lab work. I also wish to convey my greatest appreciation to my beloved parents Abdul Ghani Bin Mehat and Hasni Bte. Din for their loving encouragements as well as continuous support in completing my study.

Last but not least, I cannot adequately express my gratitude to my partner in this project also was my best friends Izzatul Haiffa Bte. Ibrahim, Norfazliza Ishak and courses mates who made these years of study a memorable one.

## ABSTRACT

Cadmium (Cd) and lead (Pb) are heavy metals that are dangerous pollutants and often deposited with natural sediment in the bottoms of streams. Heavy metal poisoning can result when heavy metal dissolved in water and is withdrawn for agricultural or human use. *Acanthamoeba* spp are microscopic and single-celled organisms that commonly found in the environment. Therefore, the purpose of this study is to investigate the effect of lead and cadmium on *Acanthamoeba castellanii* in the laboratory. Any pollutant that enters the aquatic environment will affect the life of this amoeba in the food web of aquatic system. The results obtained from this study demonstrate that lead and cadmium cause inhibition to the growth of *Acanthamoeba castellanii*'s population. In toxicity test, the most toxic metal has the lower value of EC<sub>50</sub>. In this study, only 13.4 ppm of cadmium needed to inhibit 50% of the amoeba population and 23.8 ppm of lead needed to cause such inhibition. Thus, *Acanthamoeba castellanii* seems to tolerate with high concentration of lead. The maximum inhibition observed in this study was 97.6% for Cd, and 66.27% for Pb. The amoeba cells after treatment with heavy metals were observed to be smaller and slower in movement. The treated cells after Acridine Orange Propodium Iodine Staining shows their nuclei were stained orange, indicating the lost integrity of their cell membranes, which lead to the cell death. The type of cell death observed in this study due to heavy metal toxicity is necrosis. Also under Scanning Electron Microscopy (SEM), the cells membrane of the amoeba after treatment with the heavy metal was damaged.

## **KESAN PLUMBUM DAN KADMIUM KE ATAS *Acanthamoeba Castellanii* : SUATU KAJIAN MAKMAL**

### **ABSTRAK**

Kadmium (Cd) dan plumbum (Pb) merupakan bahan-bahan pencemar yang beracun dan berbahaya. Keracunan logam berat seperti kadmium dan plumbum terjadi apabila ia larut dalam air. *Acanthamoeba* merupakan organisma unisel dan mikroskopik. *Acanthamoeba* dapat ditemui di persekitaran samada di air, udara atau tanah. Tujuan kajian ini adalah untuk menkaji kesan kadmium dan plumbum ke atas *Acanthamoeba castellanii* di makmal. Logam berat yang terdapat di persekitaran akuatik secara tidak langsung akan menjelaskan kitar hidup ameba dalam rantai makanan sistem akuatik. Keputusan yang diperoleh dari kajian ini menunjukkan kadmium dan plumbum boleh merencangkan pertumbuhan populasi *Acanthamoeba castellanii* dalam makmal. Dalam ujian ketoksikan, logam yang lebih toksik mempunyai nilai EC<sub>50</sub> yang paling rendah. Dalam kajian ini, hanya 13.4 ppm kadmium diperlukan untuk merencat 50 % populasi ameba, manakala 23.8 ppm plumbum diperlukan untuk perencatan. Tahap perencatan maksimum diperhatikan dalam kajian ini adalah 97.6% untuk Cd dan 66.27% untuk Pb. Sel-sel ameba yang telah dirawat menjadi kecil dan perlahan pergerakannya. Nukleus sel-sel yang telah dirawat dengan logam berat berwarna oren apabila diwarna dengan pewarna Acridine Orange Propodium Iodine. Ini menunjukkan ia kehilangan kekenyalan membran dan mengalami kematian sel iaitu necrosis. Di bawah Scanning Electron microscopy (SEM), sel ameba yang dirawat menjadi berlubang dan bocor membran selnya.
