ACKNOWLEDGEMENT

Alhamdulillah, praise to Allah, The Most Gracious and Merciful for giving me His blessing and the strength to finish this project. First and foremost, I would like to thank my supervisor, Prof Dr. Mohd Lokman Bin Husain for giving and sharing his ideas and suggestions to guide me in this project. I am very appreciative for all the supports that he given to me. I would also like to convey my deepest gratitude to my co-supervisor, En Mohd Suffian Bin Idris for supporting me and sharing ideas for this project. A special thanks to En Fathy and En Nasir who have help me in solving the problems faced during completing this project.

To the staff of the Oceanography Lab, especially En Raja and En Sulaiman for their dedicated work in helping me during the sample analysis at the lab.

This research could not have been accomplished without the assistance of my friends, especially Nuradzrina Hj Norani, Nadh, Ijannatul, Dawood, Ayen, Lokman, Mat Jup, Botak, Oni and Zizi, thank you for always been there for me.

Lastly, I dedicate all my works to my parents Yazed Abbas and Zairnasa Hj Nawab Khan. Abah and Ummi, thank you for everything. Only Allah can repay all the sacrifice that both of you have made for me till I am what I am now.

ABSTRACT

The main objective of this study is to determine the total suspended sediment in Tok Bali Lagoon, Kelantan. The transport of sediment and its components through a lagoon channel during spring tide was conducted on 16th September 2005. Samples are taken for 10 hours with an interval of 15 minutes. The results of the study showed that the total sediment load ranged between 0.1163 and 1.0942 kg/s⁻¹hr⁻¹. The current velocities are higher during ebb tide with an average of 0.1055 ms⁻¹ than during flood tide which is 0.0755 ms⁻¹. Meanwhile, the maximum amounts of total suspended solid occur on the earlier phase of ebb tide to the middle phase of ebb tide and in the end of flood tides. This suggests that the higher the current velocities, the higher concentrations of suspended sediment in the water.

**UNTUK MENENTUKAN JUMLAH ENAPAN TERAMPAL KETIKA AIR
PASANG PERBANI DI LAGUN TOK BALI, KELANTAN**

ABSTRAK

Objektif utama projek ini adalah untuk menentukan jumlah enapan terampai ketika air pasang perbani di Lagun Tok Bali, Kelantan. Pengangkutan sediment melalui alur Sungai Semerak ketika air pasang perbani dijalankan pada 16 September 2005. Sampel air diambil selama 10 jam dan sampel di ambil pada setiap 15 minit. Dari keputusan yang diperolehi, didapati bahawa jumlah enapan terampai ini berjulat antara 0.1163 dan $1.0942 \text{ kg/s}^{-1}\text{hr}^{-1}$. Kelajuan air adalah lebih tinggi semasa air surut dengan kelajuan puratanya iaitu 0.1055 ms^{-1} berbanding semasa air pasang yang mana kelajuannya lebih perlahan iaitu dalam 0.0755 ms^{-1} secara puratanya. Selain itu, didapati bahawa nilai maksimum enapan terampai diperolehi pada permulaan air surut dan pada penghujung air pasang. Oleh itu, dapat disimpulkan bahawa kelajuan arus memberi pengaruh yang besar terhadap jumlah enapan terampai dalam air.
