PENGAKUAN DAN PENGESAHAN LAPORAN
PROJEK PENYELIDIKAN I DAN II
RESEARCH REPORT VERIFICATION

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:
ADSORPTION OF CARBON MONOXIDE AND NITRIC OXIDE
FROM PALM SHELL BURNING ONTO COAL BASED
ACTIVATED CARBON

oleh SHARMEELA MARA KHAIROL, no. matrik: UK 8701 telah
diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan
kepada Jabatan Sains Kejuruteraan sebagai memenuhi sebahagian daripada keperluan
memperolehi Ijazah SARJANA MUDA TEKNOLOGI (ALAM SEKITAR), Fakulti Sains dan
Teknologi, Universiti Malaysia Terengganu

Disahkan oleh / Verified by:

ACKNOWLEDGEMENT

Assalammualaikum Warahmatullahi Wabarakatuh

First and foremost, I would like to thank God for His blessing and guidance for which I have successfully managed to complete my thesis writing for my final year project research.

I would like to take this opportunity to express my appreciation and sincere gratitude to my main supervisor, Dr. Marzuki Ismail for giving me the opportunity to carry out this project under his supervision and also for providing endless support, advice, guidance, and understanding. To my second supervisor Prof. Ir. Ahmad Jusoh and Puan Hajjah Noor Zaitun as my project advisor for their guidance, advices and supportive ideas which has supported and helped me in many ways. Not forgetting Encik Mahmod, Encik Ruzaimy and Encik Razman for their endless support and assistance.

My deepest gratitude goes to my parents for their endless love, support, and encouragement. Last but not least, I would like to extend my greatest appreciation to my close friends, Fennysharty Hazli, Sandra Casovia, Lee Cia Jia, Tan Wan Peng, and Faizal Ismail for their support and understanding. Thank you.

- N Graph of Percentage Reduction of NO against Time (min)

ABSTRACT

The main objective of this study is to fabricate an alternative and economical unit for the removal of ambient air pollutants, which are CO and NO from the burning of palm oil waste. Through this study as well, the correlation between the efficiency of the activated carbon in removing the pollutants and the flowrates were determined. Moreover, palm oils have emerged as one of the most important oils in the world's oils and the market of fats. About 90% of palm oil is used as food related products worldwide, and the other 10% is used for basic raw material for soap. Fibers and shells are the main wastes generated from the palm oil processes. Through this study, the concentration of CO and NO were reduced through the adsorption process using coal-based activated carbon. Readings for the concentrations of CO and NO were taken before and after the smoke goes through the activated carbon column at the flowrate of 1 L/min. The concentrations of CO and NO readings from the inlet and outlet were repeated at the flowrates of 2.0 L/min, 3.0 L/min and 4.0 L/min for seven times with 30 readings each. The use of coal-based activated carbon could efficiently remove up to 71.6488% of CO and 47.3567% of NO. As a conclusion, the coal-based activated carbon has shown potential in removing CO and NO which is emitted from the burning of palm shells and fiber.

ABSTRAK

Objektif utama kajian ini adalah untuk menghasilkan suatu unit alternatif dan murah untuk penyingkiran gas pencemar udara ke persekitaran iaitu CO dan NO yang terhasil daripada pembakaran sisa pepejal kelapa sawit. Melalui kajian ini juga, perhubungan di antara keberkesanan karbon teraktif dalam penyingkiran gas pencemar dengan halaju kadar alir juga telah ditentukan. Kelapa sawit juga telah muncul sebagai salah satu minyak yang penting di pasaran dunia minyak dan lemak. Lebih kurang 90% minyak kelapa sawit digunakan untuk produk penghasilan makanan dan 10% untuk bahan asas pembuatan sabun. Tempurung dan sabut adalah sisa utama yang terhasil daripada proses penghasilan produk kelapa sawit. Menerusi kajian ini, kepekatan CO dan NO akan dapat dikurangkan melalui proses penyerapan menggunakan karbon teraktif yang dihasilkan daripada arang.. Bacaan kepekatan kandungan CO dan NO diambil sebelum dan selepas pembakaran melalui tiub karbon teraktif, pada kadar alir 1 L/min. Pengambilan bacaan kepekatan kandungan CO dan NO diulangi pada kelajuan kadar alir pada 2 L/min, 3 L/min, dan 4 L/min sebanyak 30 bacaan dan diulangi sebanyak 7 kali. Penggunaan karbon teraktif berasaskan arang dapat mencapai kecekapan penyingkiran sebanyak 71.6488% untuk CO dan 47.3567% untuk NO. Kesimpulannya, karbon teraktif berasaskan arang berpotensi untuk menapis gas pencemar yang dibebaskan daripada proses pembakaran sisa kelapa sawit.
