ACKNOWLEDGEMENTS

A great indebted gratitude upon the Almighty Allah as for his willingness, I was able to accomplish this study successfully.

First and foremost, I would be most grateful to express my sincere gratitude to the best ever supervisor I knew, Associate Professor Dr. Mohd Effendy Abd. Wahid for his outstanding guidance and supervision throughout this study. I must also acknowledge Dr. Noraznawati Ismail as the Final Year Project Coordinator, Dr. Aziz Ahmad as the Head of Biological Department and all the Biological Department lecturer's for their inspiration and constructive comments.

I am very grateful to Mr. Syalindran in assisting and also Mr. Joseph and the INOS Science Officer's for their efforts in helping me with the ICPMS machine. I also wish to dedicate my greatest appreciation to my beloved parents, Mr. Sabaruddin and Mrs. Najima and also my siblings, Siti Nurul 'Ain, Saiful Akmal, Syafiq Ai'mullah and little Siti Nurul 'Aqilah for their loving encouragements, inspiration and endlessly support to me.

To Fadilah Mahabob, Siti Ropiah Shapai@Shafie, Aznoorlina Zainuddin, Raja Syairani Raja Soh, Hafizah Abdul Latib, Siti Zubaidah, Nieliana Na'aim, Suhaili Zakaria, Kak Siti Nur Ain, my colleagues and roommates, I cannot adequately express my thankfulness to all of you for the valuable assistance each time I need help, support and courage. Thank you very much.

Last but not least, to everyone who has involved direct or indirectly during the completion of this study, thanks a lot. I really appreciate that.

ABSTRACT

The potential of plants to absorb heavy metals can be determined by obtaining the differences between the plants' metal sorption rate and the amount of metal in the plants itself. In this study, the potentials of leaves, barks and roots of three mangrove species; *Avicennia marina*, *Bruguiera cylindrica* and *Sonneratia alba*, to absorb Cd²⁺, Pb²⁺ and Cu²⁺ was successfully determined. Samples with the powder concentration of 0.5 mg/ml and an initial metal solution concentration of 100 ppm was analyzed using ICP-MS. Root portion appeared to be the best part of plant to absorb metal solution with the following order of root > leaf > bark. The average metal sorption value by root is 0.527 ppm, leaf; 0.449 ppm and bark; 0.322 ppm. The heavy metals absorbed was determined in order of Pb²⁺ > Cd²⁺ > Cu²⁺ with the averaged value of 1.003 ppm, 0.246 ppm and 0.049 ppm, respectively. *B. cylindrica* distinctively appeared to be the most excellent plant that is capable to absorb metal in aqueous solution among all species studied with the indicated order of *B. cylindrica* (0.455 ppm) > *A. marina* (0.436 ppm) > *S. alba* (0.406 ppm). Overall, the root of *B. cylindrica* appeared to be the best ionic metal absorber of all other sorbents studied with the value of 1.402 ppm metal uptake. Based on this study, it was found that all of the mangrove plants' constituents studied have a great potential in absorbing heavy metals in aqueous solution. The findings from this study are important to initiate further research in developing bioremediation method using mangrove plants to treat metal contaminated area.

**POTENSI *Avicennia marina*, *Bruguiera cylindrica* DAN *Sonneratia alba*
SEBAGAI PENYERAP LOGAM BERAT**

ABSTRAK

Potensi tumbuhan untuk menyerap logam berat boleh di peroleh dengan cara menentukan perbezaan antara kadar penyerapan logam berat oleh tumbuhan itu dengan jumlah logam berat yang terdapat di dalam tumbuhan itu sendiri. Dalam kajian ini, potensi bahagian daun, kulit pokok dan akar tiga spesis tumbuhan paya, *Avicennia marina*, *Bruguiera cylindrica* dan *Sonneratia alba* untuk menyerap Cd²⁺, Pb²⁺ dan Cu²⁺ telah berjaya diperolehi. Sampel dengan kepekatan serbuk 0.5 mg/ml dan kepekatan awal larutan logam berat 100 ppm dianalisa menggunakan ICP-MS. Bahagian akar telah dikenalpasti menjadi bahagian tumbuhan yang paling berpotensi untuk menyerap logam dari larutan dengan tertib akar > daun > kulit pokok. Purata nilai kadar penyerapan oleh bahagian akar ialah 0.527 ppm, daun; 0.449 ppm and kulit pokok; 0.322 ppm. Plumbum merupakan logam yang paling berpotensi untuk diserap berbanding logam lain dalam aturan Pb²⁺ > Cd²⁺ > Cu²⁺ dengan nilai purata 1.003 ppm , 0.246 ppm dan 0.049 ppm masing-masing. Dengan mengambil kira seluruh tumbuhan, kadar penyerapan logam dari larutan akues adalah paling tinggi oleh spesis *B. cylindrica* diikuti oleh *A. marina* dan *S. alba* mengikut aturan *B. cylindrica* (0.455 ppm) > *A. marina* (0.436 ppm) > *S. alba* (0.406 ppm). Secara keseluruhannya, akar *B. cylindrica* merupakan penyerap logam dari larutan akues yang terbaik jika dibandingkan dengan sampel lain dengan nilai 1.402 ppm. Berpandukan dari kajian ini, didapati bahawa semua bahagian tumbuhan yang dikaji mempunyai potensi yang besar untuk menyerap logam berat dari larutan akues. Keputusan dari kajian ini adalah penting untuk mendalami kajian cara perawatan kawasan yang dicemari logam berat dengan kaedah biologi.
