RESEARCH REPORT VERIFICATION

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: ATTRACTION OF MAN-MADE ANIMAL ROOSTS WITH EMPHASIS ON BATS AT MANGROVE AND GARDEN AREA OF UNIVERSITI MALAYSIA TERENGGANU oleh Amelia Baizatul Raiha Bt Baharuddin, no. matrik: UK 10351 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Biologi sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains Gunaan (Pemuliharaan dan Pengurusan Biodiversiti), Fakulti Sains dan Teknologi, Universiti Terengganu Malaysia.

ACKNOWLEDGEMENTS

First of all, I would like to thank my supervisor Mr. Wong Chee Ho for giving me opportunities to learn something through this final year project, his guidance and valuable advises. Thanks to the Biological Department for providing financial support for this project.

I also would like to express my gratitude to lab assistants; Tn. Hj. Muhammad Embong, Mr. Hasan and Mr. Mazrul for helping me build the man-made animal roosts and give supports from early stage of this project. This appreciation is also goes to Hasrul Hasri Mat Saad, who is always keep accompanying me during sampling and give morale supports. Not to forget, Roshila Riduan Shah, Fairos Abd Rahim, Zatul Himmah Samsudin and Asuar Ayuni Anuar for helping me in so many ways to complete this project. Not to forget, a special thanks to all lecturers who give me precious ideas and comments to improve this project.

Special thanks I dedicated to Mrs. Serafina Christine Fletcher and Marilyn for providing information regarding this project and for sharing the precious ideas. Last but not least, thanks to Dr. Tigga Kingston and Mr. Rakhmad Sujarno Kudus for allowing me working with Malaysia Bat Conservation Unit (MBCRU) to gain some experiences in doing scientific research that can be applied in my project.

ABSTRACT

The study of man-made animal roost is vital to develop conservation tools in animal's conservation efforts. This study was conducted at mangrove and garden area of Universiti Malaysia Terengganu (UMT) to investigate the attraction of man-made animal roosts. A total of 48 man-made animal roosts have been placed at two sites respectively. A total of 31 individuals from four different classes were recorded which were Reptile, Arachnida, Aves and Insecta. Reptile is the most dominant animal with 68% followed by arachnida (16%), aves (10%) and insecta (6%). Garden site was most preferred by the animals (83.9%). Both designs marked equally in term of occupancy rate. West facing roosts attracted four classes of animals but there was no significant difference between the occupancy of animals within four directions. No bats have been found during the sampling. The occupancy of animals proven that there are several types of animals that attracted to man-made animal roosts especially at garden site compared to mangrove site. The increasing number of animals was indicated that the man-made animal roost has the feasibility as a conservation tools.

**TARIKAN HABITAT HAIWAN BUATAN MANUSIA DENGAN
MEMFOKUSKAN KEPADA KELAWAR DI HUTAN PAYA
LAUT DAN KAWASAN TAMAN DI UNIVERSITI
MALAYSIA TERENGGANU**

ABSTRAK

Kajian tentang habitat haiwan buatan manusia sangat penting untuk membangunkan sesuatu alat pemuliharaan di dalam usaha pemuliharaan haiwan. Kajian ini telah dijalankan di hutan paya laut dan taman di Universiti Malaysia Terengganu (UMT) untuk mengkaji tarikan habitat haiwan buatan manusia. Sejumlah 48 habitat haiwan buatan manusia telah di gantung di kedua-dua kawasan penyelidikan. Sebanyak 31 haiwan yang berlainan kelas iaitu Reptilia, Araknida, Avian dan Serangga telah direkodkan. Reptilia merupakan haiwan paling dominant dengan 68% diikuti oleh araknida (16%), avian (10%) dan serangga (6%). Kawasan taman menarik lebih banyak bilangan individu haiwan (83.9%). Kedua-dua bentuk habitat haiwan merekodkan jumlah yang sama bagi kadar penghunian. Habitat haiwan yang menghala ke arah barat telah menarik empat kelas haiwan tetapi tiada perbezaan penting di antara kadar penghunian haiwan di empat arah mata angin. Tiada kelawar yang berjaya direkodkan sepanjang kajian. Penghunian haiwan membuktikan bahawa terdapat haiwan yang tertarik untuk menghuni habitat haiwan buatan manusia terutamanya di kawasan taman berbanding kawasan hutan paya laut. Peningkatan bilangan haiwan menandakan bahawa habitat haiwan buatan manusia mempunyai kemunasabahan sebagai alat pemuliharaan.
