**PENGAKUAN DAN PENGESAHAN LAPORAN PITA I DAN II**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: **IDENTIFICATION AND CHARACTERIZATION OF BACTERIA FROM FRESHWATER FISH, *Oxygaster anomala*** oleh **SITI NOR HUDA BINTI ABD. GHANI**, No. Matrik: **UK 12294** telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Biologi sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah **SARJANA MUDA SAINS (SAINS BIOLOGI)**, Fakulti Sains dan Teknologi, Universiti Malaysia Terengganu.

## **DECLARATION**

I hereby declare that this thesis entitled **IDENTIFICATION AND CHARACTERIZATION OF BACTERIA FROM FRESHWATER FISH, *Oxygaster anomalura*** is the result of my own research except as cited in the references.

Signature :

Name : SITI NOR HUDA ABD. GHANI

Matric. No : UK12294

Date : 13.5.2008

## **ACKNOWLEDGEMENTS**

First of all, I would like to express my highest grateful to Allah SWT, for blessing and giving me strength to accomplish this project successfully.

First and foremost, I wish to express my sincere gratitude and highly appreciation to my supervisor Dr. Noraznawati Ismail for her kindness, advises and guidance on this project. I had learned many new things in this project under her supervision. I also would like to convey my sincere gratitude to En. Lokman for helping and guiding me to accomplish this project.

Besides that, I also would like to thank to all lecturers, Science Officers and Lab Assistants of Department of Biological Sciences that always give a good cooperation and helped me during this project.

I also wish to thank my parent and my siblings who gave me support to the success of this project. I also appreciate my beloved friends who gave me full commitment, strength and support.

Lastly, thanks also to everyone who advised and support direct or indirectly.

## ABSTRACT

Identification of bacteria from polluted areas including freshwater environment are important especially for health development to mankind. To date, bacteria are used for bio-indicator and proven to be the fastest method of identifying polluted area. The aims of this study are to isolate, to identify and to characterize bacteria from freshwater fish, *O. anomalura*. A hundred of bacteria isolates were cultured on MacConkey and Nutrient agar. Biochemical tests were used to identify bacteria isolates at genus and species level. The genus and species that had been identified were *Serratia fonticola*, *Aeromonas* sp., *Aeromonas salmonicida*, *Citrobacter freundii*, *Klebsiella pneumoniae*, *Serratia* sp., *Neisseria flavescens*, *Neisseria* sp., *Serratia liquefaciens*, *Enterobacter aerogenes*, *Staphylococcus* sp., *Corynebacterium xerosis*, *Citrobacter diversus*, *Aeromonas veronii*, *Enterobacter intermedius*, *Pseudomonas* sp. and *Corynebacterium kutscheri*. The most abundant bacteria isolated were from Gram-negative bacteria which were from *Neisseria* sp., 20% followed by *Staphylococcus* sp., 13 %. The abundance of *Staphylococcus* sp. in Paya Sungai Udang indicated that the area was contaminated with fecal. 81% of the total numbers of bacteria isolates were Gram-negative bacteria. The finding of this study is in agreement with previous study indicated that Gram-negative bacteria dominated the freshwater fish.

## ABSTRAK

Pengecaman bakteria dari kawasan tercemar termasuklah persekitaran air tawar adalah penting terutamanya untuk kemajuan kesihatan manusia. Pada masa kini, bakteria digunakan sebagai bio-indikator dan terbukti menjadi kaedah paling cepat menentukan kawasan tercemar. Objektif untuk kajian ini ialah untuk memencil, mengecam dan menciri bakteria daripada ikan air tawar, *O. anomalura*. 100 bakteria yang dipencarkan dikulturkan ke atas agar MacConkey dan agar Nutrien. Ujian biokimia digunakan untuk menentukan bakteria yang dipencarkan kepada peringkat genus dan spesies. Genus dan spesies yang telah dicamkan ialah *Serratia fonticola*, *Aeromonas* sp., *Aeromonas salmonicida*, *Citrobacter freundii*, *Klebsiella pneumoniae*, *Serratia* sp., *Neisseria flavescens*, *Neisseria* sp., *Serratia liquefaciens*, *Enterobacter aerogenes*, *Corynebacterium xerosis*, *Citrobacter diversus*, *Aeromonas veronii*, *Enterobacter intermedius*, *Pseudomonas* sp., *Staphylococcus* sp. dan *Corynebacterium kutsceri*. Bakteria yang paling banyak dipencarkan ialah bakteria Gram-negatif terdiri daripada *Neisseria* sp. iaitu 20% diikuti oleh *Staphylococcus* sp. iaitu 13%. Taburan *Staphylococcus* sp. di dalam Paya Sungai Udang menunjukkan yang kawasan tersebut dicemari dengan tinja. 81% daripada jumlah bakteria yang dipencarkan ialah bakteria Gram-negatif. Penemuan dalam kajian ini mempersetujui dengan kajian sebelumnya menunjukkan yang bakteria Gram-negatif mendominasi ikan air tawar.
