DECLARATION AND VERIFICATION REPORT RESEARCH PROJECT I AND II

It is hereby declared and verified that this research report entitled: Application of water column correction in benthic habitat mapping by Thien Ka Foong, Matric No UK 14752 have been examined and all errors identified have been corrected. This report is submitted to the Department of Marine Science as partial fulfillment towards obtaining the Degree Bachelor of Science (Marine Science), Faculty of Maritime Studies and Marine Science, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENTS

This research report and final year project would not have been success without the generous help of the following people and I am extremely thankful to them for their time, advice, help and useful discussions. First of all, I would like to thank my first supervisor Prof. Madya Dr Aidy @ M.Shawal Bin M.Muslim. Dr has been given me a lot of workshops about the function of IDRISIS software to produce benthic habitat map and to do research about my final year project. Dr had scarified a lot of his precious time to teach me about the software and useful knowledge about remote sensing, benthic habitat mapping and image processing. Secondly, I like to thank my second supervisor En.Idham bin Khalil for his useful knowledge and information regarding to my project. Apart from them, I would like to thank Dr. Zainudin Bachok for taking me to sampling at Lang Tengah Island. Last but not least, Dr Antonina and Dr Juanita had also provided me information about the format about writing proposal, report and leading me to finish my final year project. Thank you to Dr Antonina and Dr Juanita.

ABSTRACT

QuickBird satellite can capture image of large area without contact with it. The image needs to be process to have better accuracy. The main objective of this project is focused on the differences between image that had undergone water column correction and without water column correction process. The images used are from QuickBird satellite. The software I used to process the image is IDRISI Andes. Image processing of Lang Tengah island image included geometric correction, atmospheric correction, masking, water column correction, supervised correction and lastly accuracy assessment. The algorithm used for atmospheric correction is ATCOR 2 that used on flat terrain. Masking in this project is to remove the unwanted area that is the land and consider the sea as wanted area. Water column correction used in this project is Lyzenga method to remove the effect of absorption and scattering caused by water. Method used for supervised classification is Minimum Distance which was applied to the images that the water column had been corrected and uncorrected. Accuracy assessment was done to the images to find out which image has better accuracy. To complete the supervised classification and accuracy assessment, in-situ data that is bottom types are required. Sampling activity was done to get the in-situ data. The result of the project show that images with water column correction is more accurate than images without water column correction. Band 1 (blue band) image has better accuracy compared to band 2 (green band) and band 3 (red band) image.

PENGGUNAAN PEMBETULAN AIR COLUM DALAM PEMETAAN PENGHUNIAN BENTHIC

ABSTRAK

QuickBird satelit boleh memberi maklumat tentang sesuatu kawasan yang luas tanpa menyentuhnya. Gambar tersebut perlu diproses untuk meningkatkan ketepatannya. Objektif utama projek ini ialah untuk membandingkan gambar satelit yang menjalankan 'water column correction' dan gambar yang tidak menjalankan 'water column correction'. Gambar yang digunakan dalam projek ini ialah dari Quickbird satelit. IDRISI Andes digunakan untuk memproses gambar tersebut. Langkah untuk memproses gambar satelit ialah 'geometric correction', 'atmospheric correction', 'masking', 'water column correction', 'supervised classification' dan 'accuracy assessment'. Algoritem yang digunakan untuk 'atmospheric correction' ialah ATCOR 2 (topografi rata). 'Masking' dalam projek adalah mengeluarkan kawasan yang tidak diperlukan iaitu darat dan memberi tumpuan kepada kawasan yang diingini iaitu laut. 'Water column correction' yang saya gunakan dalam projek ini ialah 'Lyzena method' untuk membuang kesan penyerapan dan pembantulan yang disebabkan oleh air. Cara 'supervised classification' yang digunakan pada gambar satelit yang menjalankan 'water column correction' dan gambar satelit yang tidak menjalankan 'water column correction' ialah Minimum Distance. Fungsi 'accuracy assessment' ialah untuk membanding gambar satelit manakah yang mempunyai ketepatan yang paling tinggi. Untuk menjalankan proses 'supervised classification' dan 'accuracy assessment', in-situ data iaitu jenis bottom diperlukan. In-

situ data boleh didapati melalui pengambilan sampel. Keputusan menunjukkan gambar satelit yang menjalankan 'water column correction' mempunyai ketepatan yang lebih tinggi daripada gambar satelit yang tidak menjalankan 'water column correction'. Selain itu, Gambar satelit jalur 1 (jalur biru) mempunyai ketepatan yang lebih tinggi berbanding dengan gambar satelit jalur 2 (jalur hijau) dan jalur 3 (jalur merah).
